

Fire-Resistant Hazmat Placards from INPS

Safer Hazmat Identification for the Chemical Transportation Industry

Designed to help chemical producers, carriers, and emergency responders maintain access to critical hazardous material information during fire events.

Durable

Compliant

Fire Resistant

Designed for railcars, tank trucks, and hazardous material transportation, the INPS Fire-Resistant Hazmat Placard combines a UV-resistant PVC face with a laser-cut galvanized steel backing to provide long-term durability and enhanced identification retention during fire events.

Developed to address the transportation industry's growing focus on placard survivability following the East Palestine derailment.

The NTSB concluded that the vulnerability of tank car placards to fire exposure resulted in illegible placards and hampered emergency responders' efforts to identify hazards. It recommended that PHMSA require placards to survive fires and accidents and remain legible during emergencies.

When Seconds Matter

During a derailment, accident, or fire, rapid hazardous material identification is critical. Unlike conventional placards that may become damaged under extreme conditions, the INPS Fire-Resistant

Hazmat Placard is designed to help preserve critical identification information for emergency responders.

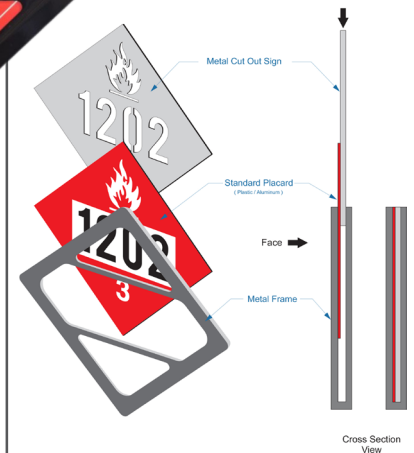

As part of the industry's ongoing focus on placard survivability, INPS presented its patented Fire-Resistant Hazmat Placard to PHMSA leadership in Washington, D.C. Our patented design remains unique in today's marketplace.

Product Construction

- Durable UV-resistant PVC face
- Laser-cut galvanized steel backing
- Supplied fully assembled
- Galvanized steel melting point approximately 2,500°F

Why INPS?

- Trusted transportation identification supplier
- Manufactured and assembled in the USA
- Specialists in rail, fleet, and hazardous material marking solutions

Placard Assembly

Contact INPS today for pricing, availability, and sample requests.
